Annual Sustainability Report

Fiscal Year 2025, Harrow & Vane Logistics

Contents

Executive Summary 2

Emissions Performance 2

Direct Emissions 2

Energy Use by Site 2

Outlook 3

Executive Summary

Harrow & Vane cut its direct emissions by **twelve percent** in fiscal 2025, the third consecutive year of reduction. This report sets out what changed, what it cost and what comes next.

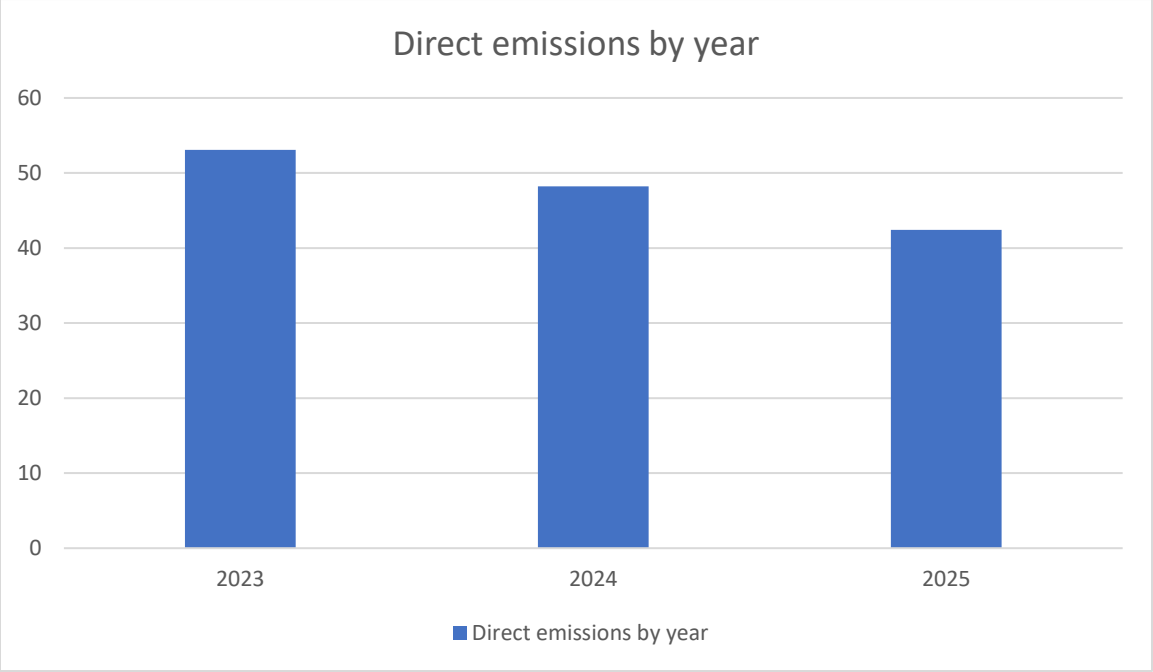

Three programs produced most of the reduction:

- Replacing diesel vans in six urban depots with electric vehicles
- Installing rooftop solar at the Tilbury and Hull warehouses
- Rerouting night freight to reduce empty running

Emissions Performance

Direct Emissions

Direct emissions fell from 48,200 tonnes to 42,400 tonnes of carbon dioxide equivalent.[1] Fleet electrification accounted for roughly two thirds of the fall.

The chart above shows the direct emissions recorded in each of the last three fiscal years.

Energy Use by Site

Electricity use varied widely by site. The table below shows the five largest sites, which together account for most of the total.

[1] Figures follow the GHG Protocol Corporate Standard, using market-based factors.

Table 1: Electricity use at the five largest sites

Site	Electricity (MWh)	Change	Renewable share
Tilbury	18,450	-6.2%	41%
Hull	12,310	-3.8%	37%
Leeds	9,875	+1.4%	12%
Bristol	7,640	-0.9%	18%
Glasgow	6,205	-2.1%	22%

Outlook

The company has committed to the following steps for fiscal 2026:

1. Electrify a further four depots
2. Complete an independent audit of supply chain emissions
3. Publish quarterly progress figures
